CIRP Construct Definition Summarizes the theoretical ationale for creating the construct.

Standard Deviation - Measures he variability around the mean. A mall standard deviation indicates hat the responses for the onstruct tend to be very close to the mean, whereas a large standard deviation indicates that the responses are spread over a larger range of response options.

Statistical Significance est to examine the differenee between the mean construct score for your institution and the comparison group. Constructs with mean differences that are larger than would be expected by chance are noted with one, two, or three stars, which correspond to the three standard levels of significance ( ${ }^{*}$ p $<.05$, **p<. 01 and ${ }^{* * *} p<.001$ ). Statistical significance measures the extent to which a difference is occurring by chance, not the extent to which a difference is important. Large sample sizes (like those in the comparison groups) tend to generate statistical significance even though the magnitude of the difference may be small and not practically significant. In order to provide additional context to tatistical significance, effect size are provided.

CIRP Constructs are designed to capture the experiences and outcomes institutions are often interested in understanding, but that present a measurement challenge because of their complex and multifaceted nature. To measure these broad underlying areas more precisely, we use Item Response Theory (IRT) to combine individual survey items into global measures that capture these areas. CIRP Constructs are more than a summation of related items; $\operatorname{IRT}$ uses response patterns to derive construct score estimates while simultaneously giving greater weight in the estimation process to survey items that tap into the construct more directly. This results in more accurate construct scores. Constructs are particularly useful for benchmarking. They allow you to determine if the experiences and outcomes for your students differ from your comparison groups. Two sets of reports are generated for CIRP Constructs. The Mean Report shows comparative information based on the mean score of a construct. The Percentage Report shows comparative information based on the percentage of students who score in the high, average, and low score group of a construct. We suggest you use the report that best fits your needs as an institution.

Academic Self-Concept is a unified measure of students' beliefs about their abilities and confidence in academic environments.

| Sample University | Total |  |  | Men |  |  | Your Inst | $\underset{\text { Comp } 1}{\underline{\text { Women }}}$ | Comp 2 |

urvey items and estimation "weights":
Rate yourself on each of the following traits as compared with the average person your age: * Academic ability (3.01)
*Self-confidence (intellectual) (1.51)
"Drive to achieve (1.18)
Mathematical ability (1.14)

Survey Items and Estimation "Weights" - The survey items used in the creation of the CIRP Construct are presented in the order in which they contribute to the construct along with the estimation weights generated in RT. Items that tap into a trait more effectively are given greater weight in the estimation process.

For more information about IRT and the CIRP Construct development process, see the CIRP Constructs Technical Report at www.heri.ucla.edu

Comp 1 - The first comparison roup is based on your institution's type and control.

Comp 2 - The second comparison group is based on a similar grouping of institution ype and control.

Mean - The arithmetic mean is computed for each CIRP Construct based on th construct score. CIRP constructs have been scaled to population mean of 50 with a standard deviation of 10 .

## Effect Size - Determines the practical significance of the

 mean difference between your institution and the comparison group. It is calculated by dividing the mean difference by he standard deviation of the comparison group. Generally an effect size of .2 is considered small, .5 medium and .8 large. A positive sign indicates that your institution's mean is greater than the mean of the comparison group; a negative sign indicates your mean is smaller than the mean of the comparison group. Note hat a negative effect size is ometimes preferred (e.g., a egative effect size on the "Academic Disengagement" IRP Construct suggests your tudents score lower than comparison schools).
## 2017 College Senior Survey CIRP Construct Mean Report <br> Habits of Mind <br> Graduating Seniors

Habits of Mind is a unified measure of the behaviors and traits associated with academic success. These learning behaviors are seen as the foundation for lifelong learning.

## Survey items and estimation "weights":

How often in the past year did you:

* Support your opinions with a logical argument (2.30)
* Seek solutions to problems and explain them to others (2.25)
* Seek alternative solutions to a problem (1.90)
* Evaluate the quality or reliability of information you received (1.73)
* Ask questions in class (1.50)
* Take a risk because you felt you had more to gain (1.39)

| 75th percentile | 57.8 | 59.3 | 59.9 | 56.2 | 59.5 | 60.7 | 57.9 | 59.1 | 59.5 |

Note: Significance * p<.05, ** p<.01, *** $p<.001$

## Survey items and estimation "weights":

* Use technical science skills (use of tools, instruments, and/or techniques) (1.61)
* Generate a research question (3.75)
* Determine how to collect appropriate data (4.02)
* Explain the results of a study (5.27)
* Use scientific literature to guide research (4.32)
* Integrate results from multiple studies (3.72)
* Ask relevant questions (2.47)
* Identify what is known and not known about a problem (2.20)
* Understand scientific concepts (2.54)
* See connections between different areas of science and mathematics (1.55)

CIRP Constructs are designed to capture the experiences and outcomes institutions are often interested in understanding, but that present a measurement challenge because of their complex and multifaceted nature. To measure these broad underlying areas more precisely, we use Item Response Theory (IRT) to combine individual survey items into global measures that capture these areas. CIRP Constructs are more than a summation of related items; IRT uses response patterns to derive construct score estimates while simultaneously giving greater weight in the estimation process to survey items that tap into the construct more directly. This results in more accurate construct scores. Constructs are particularly useful for benchmarking. They allow you to determine if the experiences and outcomes for your students differ from your comparison groups. Two sets of reports are generated for CIRP Constructs. The Mean Report shows comparative information based on the mean score of a construct. The Percentage Report shows comparative information based on the percentage of students who score in the high, average, and low score group of a construct. We suggest you use the report that best fits your needs as an institution.

Survey items and estimation "weights":
Rate yourself on each of the following traits as compared with the average person your age
*Academic ability (3.01)

* Self-confidence (intellectual) (1.51)
* Drive to achieve (1.18)
* Mathematical ability (1.14)

For more information about IRT and the CIRP Construct development process, see the CIRP Constructs Technical Report at www.heri.ucla.edu

CIRP Construct Definition Summarizes the theoretical rationale for creating the construct.

Comp 1 - The first comparison group is based on your institution's type and contro

Comp 2 - The second comparison group is based on a similar grouping of institution type and control

Statistical Significance - uses a proportional difference test to examine the difference between the percentage of students in the high group for your institution and the percentage of students in the high group in the comparison group. Differences larger than what would be expected by chance are noted with one, two, or three stars, which correspond to the three standard levels of significance ( ${ }^{*} p<.05,{ }^{* *} p<.01$, *** $p<.001$ ). Statistical significance measures the extent to which a difference is occurring by chance, not the extent to which a difference is practically important. Large sample sizes (like those in the comparison groups) tend to generate statistical significance even though the magnitude of the difference might be small and not practically important.

Survey Items and Estimation "Weights" - The survey items used in the Charts - Provide a visual display of construct score group percentages for your institution and two comparison groups. CIRP creation of the CIRP Construct are presented in the order in which they contribute to the construct along with the estimation weights generated in IRT. Items that tap into a trait more effectively are given greater weight in the estimation process.

Constructs have been scaled to a mean of 50 with a standard deviation of 10 . "Low" represents students who scored one-half standard deviation or more below the mean (less than 45). "Average" represents students who scored within one-half standard deviation of the mean ( 45 to 55 ). "High" represents students who scored one-half standard deviation or more above the mean (higher than 55).
